

10 Tips to Enhance Security for Connected Legacy Systems

01

Change the default password for your networking devices

Disable unused yet connected ports and services

02

OFF

03

Verify the firmware source before an update

Use secure communication protocols (i.e., HTTPS)

04

05

Only allow authorized users to access your devices and network

Encrypt critical data before transmissions

06

07

Constantly monitor that your networking devices are at the desired security level

Periodically perform vulnerability scanning for potential threats

08

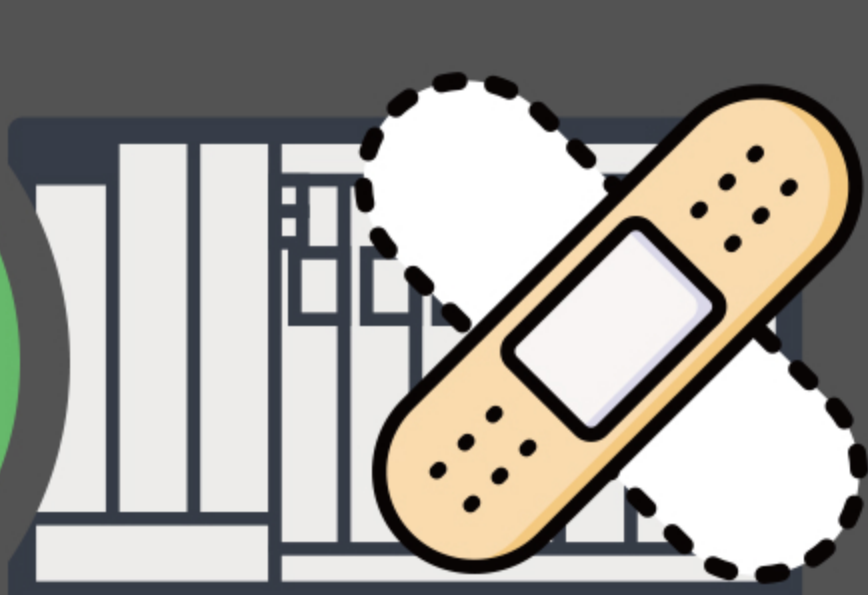

09

Perform security patching for your networking devices to reduce vulnerabilities

10

Use virtual patching for known vulnerabilities in your legacy systems
